

Move from your current view to the switch on the wall to turn on the light

Target object

Current view

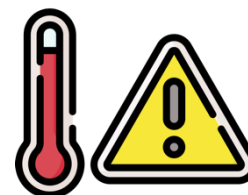

Directly reason from available RGB frames

History frames

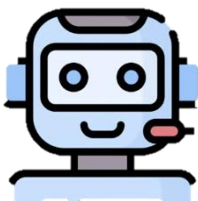

Cannot reliably relate objects across views

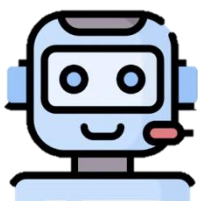

More frames add redundant visual tokens.

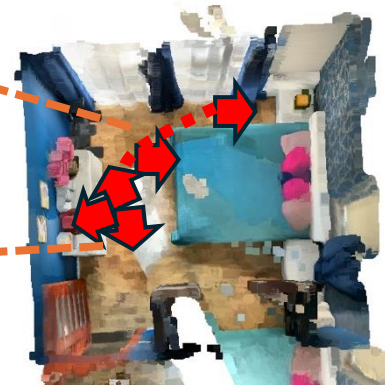

Actively require task-related views

I should first step back to see how the nightstand placed in the room

After stepping back, turn right/ left /back to find the target and try to finalize the route

externalize the state of 3D scene
